What are solar microinverters?

Microinverters are small electronic devices that convert direct current (DC) into alternating current (AC). One microinverter could fit the palm of your hand. The main factor differentiating microinverters from traditional inverters is that they operate at the panel level rather than the solar panel system as a whole.

How much does a microinverter cost?

Microinverters typically cost a couple of hundred dollars per unit. While they offer many advantages, which we will cover further, microinverters are notably costlier than string inverters when installed on an entire solar power system.

How do microinverters work?

Microinverters convert the electricity from your solar panels into usable electricity. Unlike centralized string inverters, which are typically responsible for an entire solar panel system, microinverters are installed at the individual solar panel site.

Where should a microinverter sit on a solar panel?

Alternatively, string inverters typically sit more conveniently on the side of your house. Clipping refers to power losses associated with microinverters and is an important consideration when shopping for a solar panel system. Often, the power output rating of your microinverter is lower than that of the panel itself.

There are many solar platforms that provide enough information and data about the solar industry in your region, including all the reliable solar wholesalers in town.
