What is the cycle life of a lithium battery?

The cycle life of a lithium battery refers to the number of charge and discharge cycles it can complete before its capacity significantly degrades. 1. Depth of Discharge (DoD) The Depth of Discharge (DoD) measures how much of the battery's capacity is used during each cycle.

How do you prolong the life of a lithium battery?

Instead, use partial cycles (20%-80%) to prolong battery life. Proper care and maintenance can significantly extend the lithium battery lifespan, saving costs and enhancing reliability. Here are five proven strategies to maximize the lithium battery life expectancy.

How long does a lithium phosphate battery last?

When the temperature range is from 35°C~40°C for LFP, the calendar life is 5-6 years. But over 45°C, the calendar life will be shortened to 1-2 years. Different cathode materials have varying calendar life properties. For example, lithium iron phosphate (LFP) batteries often have a longer calendar life than nickel-rich chemistries.

How long does a lithium ion battery last without charging?

A lithium-ion battery can last somewhere between 2 and 6 months without charging. However, it is applicable when you store the battery in a cool, dry place and maintain it regularly. If it is not stored in ideal conditions, the charging time can be reduced accordingly.
