Can a hybrid model predict short-term passenger flow during subway station closures?

In this study, we propose a hybrid model for predicting short-term passenger flow during subway station closures. First, a spatiotemporal ensemble prediction model is used to capture the temporal characteristics of passenger flow at each station and the spatial characteristics of passenger flow among distinct groups of stations.

Is the EDFM-SVR model suitable for a station closure event?

In summary, the EDFM-SVR model outperforms the baseline models and is suitable for deployment to numerous stations with possible station closures. Table 9. Comparison of prediction result for Junshibowuguan station closure event.

How to predict short-term passenger flow in subway systems?

Many studies have been conducted on short-term passenger flow prediction in subway systems and they are categorized into classic statistical and machine learning models. Classic statistical models are extensively applied and mainly include autoregressive integrated moving average (ARIMA) and exponential smoothing-based models.

What is the second scenario of station closures?

The second scenario of station closures was taken as an example for a detailed description. First, the trend similarity of passenger flow at different stations was identified and the stations were clustered into three groups of stations, as displayed in Table 5.

In this study, we take the Beijing subway as an example to study the nature of PPS phenomena from a view point of statistical physics, in which both an ideal model and a realistic data-driven ...

The results for the 18 stations on Beijing subway indicate that the proposed method accurately captures abnormal changes in passenger flow under station closures.

You can also optimize your transaction's performance by taking part in the Single Phase Commit protocol. For more information, see Optimization using Single Phase Commit ...

Therefore, during the design phase of transit centers, emphasis should be given to influential parameters as they illustrate the actual conditions in the transit centers.

This study elucidates the role and effectiveness of the load transfer structure during the assembly of
